## AMENDMENTS TO THE CLAIMS:

1. (Currently Amended): Apparatus for effecting a desired geometric change <u>in</u> the annulus of a heart valve and limiting mitral leaflet prolapse, said apparatus comprising:

first and second plication bands, each said plication band comprising:

first and second <u>substantially straight and parallel</u>

legs, each having a first end, <u>said the</u> first ends of said first

and second legs <u>having a tissue piercing configuration</u> <u>being</u>

adapted to pierce heart valve tissue; and

a bridge having first and second ends, said the first end of said bridge being connected to said first leg and said the second end of said bridge being connected to said second leg, such that said the first ends of said first and second legs are separated by a first given distance;

said bridge being configured such that when

said the first ends of said first and second legs have pierced tissue at said the first given distance, said bridge may be deformed is deformable so as to cause said the first ends of said first and second legs to each move toward one another the other so as to thereafter be separated by a second, shorter given

distance, whereby said first and second legs gather together the pierced tissue to effect a desired geometric change in contraction of the annulus of the heart valve; and

a linking construct connected <u>proximate a first end thereof</u> to said first <u>plication band</u> and <u>proximate a second end thereof</u> to said second plication bands.

2. (Currently Amended) A method for effecting a desired geometric change <u>in</u> the annulus of a heart valve and limiting mitral leaflet prolapse, said method comprising the steps of:

providing apparatus for effecting a desired geometric change cotraction in the annulus of a the heart valve, said the apparatus comprising:

first and second plication bands, each said plication band comprising:

first and second <u>substantially straight and</u>

<u>parallel</u> legs, each having a first end, <u>said</u> <u>the</u> first ends of

said first and second legs <u>having a tissue piercing configuration</u>

<u>being adapted to pierce heart valve tissue</u>; and

a bridge having first and second ends, said the first end of said bridge being connected to said first leg and said the second end of said bridge being connected to

said second leg, such that said the first ends of said first and second legs are separated by a first given distance;

when said the first ends of said first and second legs have pierced tissue at said the first given distance, said bridge may be deformed is deformable so as to cause said the first ends of said first and second legs each to move toward one another so as to thereafter be separated by a second, shorter given distance, whereby said first and second legs gather together the pierced tissue to effect a desired geometric change the contraction in the annulus of the heart valve; and

a linking construct connected <u>proximate a first end</u>

thereof to said first <u>plication band</u> and <u>proximate a second end</u>

thereof to said second plication bands;

deploying said the first plication band in a first portion of tissue, and deploying said the second plication band in a second portion of tissue such that said the linking construct extends across the a mouth of the valve and draws the two first and second portions of tissue together, thereby limiting leaflet prolapse.
